

# **Current use of satellite data in the Met Office Global NWP model**

**Fiona Hilton**

Nigel Atkinson, William Bell, James Cameron, Brett Candy,  
Andrew Collard (now at ECMWF), Stephen English, Mary Forsythe

**GLOBAL MODEL ONLY!**

- Major changes to satellite data assimilation since last ITSC
  - 4D-Var
  - Use of EOS Aqua data (AIRS, AMSU, MODIS winds)
  - EARS
  - RTTOV 7
  - More ATOVS data over high land
  - No longer assimilating HIRS data for technical reasons
- Comment on late ATOVS data
- Planned improvements for the coming year
  - System changes
  - New data sources
- MetOp

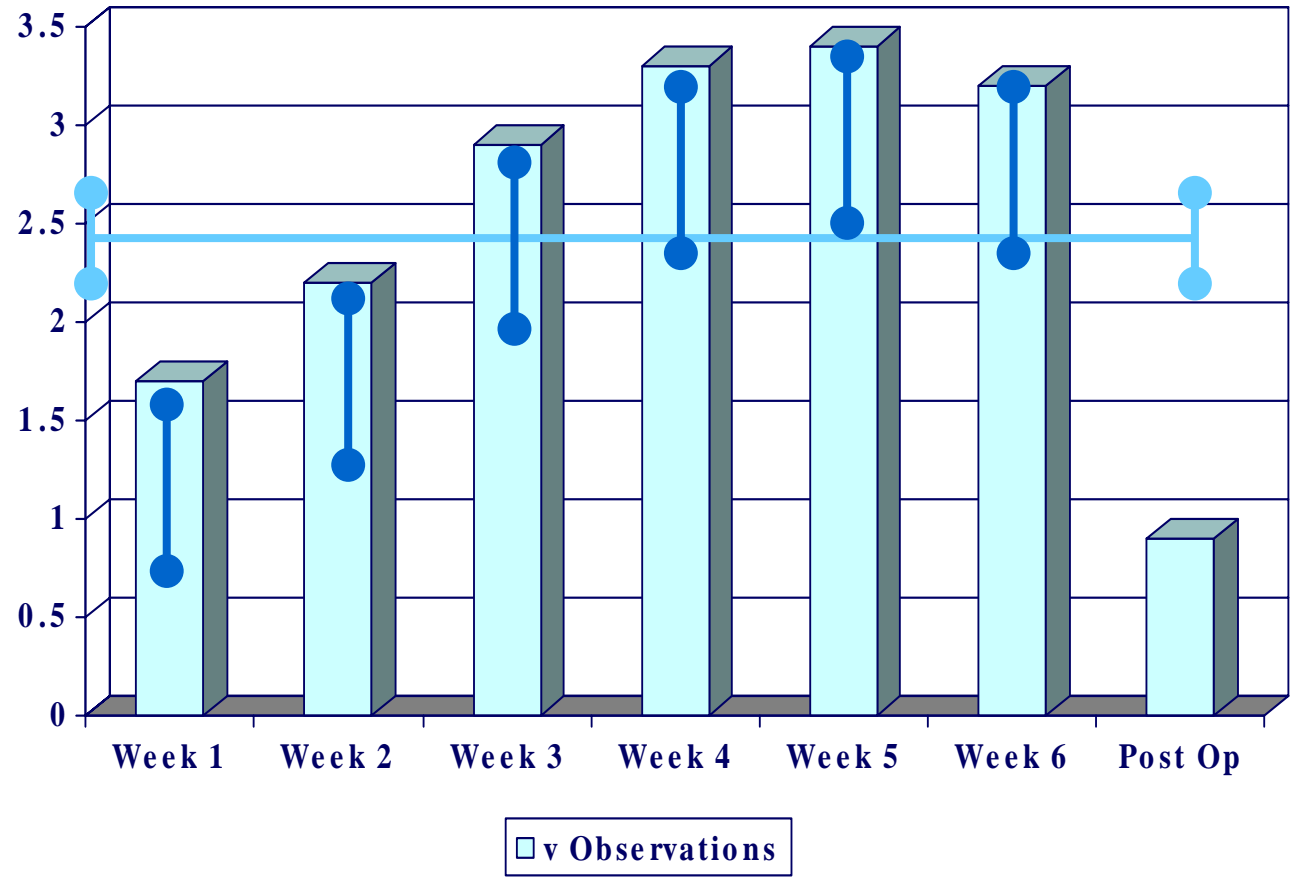

# Changes to Satellite Data Assimilation

- Data Assimilation algorithm changed from 3D-Var to 4D-Var on 5<sup>th</sup> October 2004: ONLY change was in algorithm → clean comparison
- The global model is non-hydrostatic, with a finite difference lat-long grid, resolution N216 (~60km), with 38 levels (hybrid in height) and model top at 40km.
- The operational suite contains 4 update assimilation cycles for 6-hour data windows, with 2 main 6-day forecasts run daily from 00Z and 12Z.
- Inner loops with linear Perturbation Forecast (PF) model as opposed to full tangent linear.
- Non-linear updates every 10<sup>th</sup> iteration.
- **Timeliness is critical**: the main forecasts have a data cut-off at T+2 hours; and T+7 hours for update runs.

- Very significant improvements in NWP index (basket of scores):
  - +2.57 vs Observations;
  - +1.14 vs Analyses
- Biggest differences in winter storm tracks
- Fewer 'busts'
- Signal from upper troposphere ATOVS
- Fit of observations to background improved

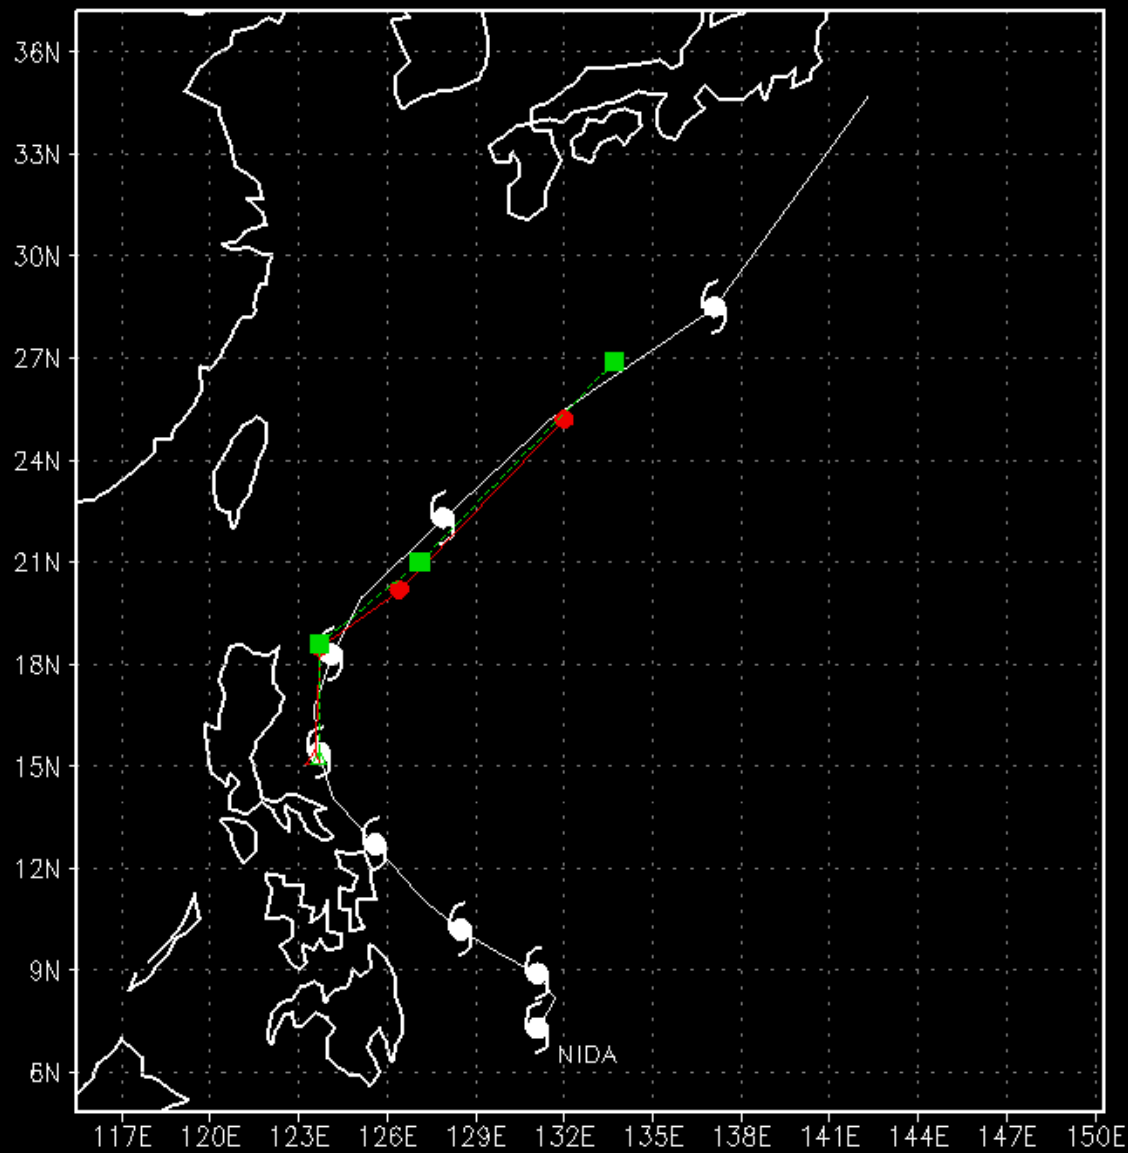

- Package of changes including
  - Use of AIRS data
  - Use of EOS Aqua AMSU data
  - EARS data included in assimilation
  - More ATOVS data over high land
  - RTTOV 7 for ATOVS
- Impact expected overall...
  - ...on the basis of component tests +2.2

# May 2004 Upgrade: Package Trial Verification – weighted global score

- We found major positive impact
  - positions 10% better, intensity increased, picked up more quickly and developed more rapidly (well before TC bogus kicks in).
- First TC post upgrade was superbly forecast (again well analysed before TC bogus).
- Combined with ECMWF experience (step improvement when AIRS and Aqua AMSU-A went in) we can say with reasonable confidence that AIRS has an important impact on TC forecasts.

KEY to FORECAST TRACKS

(Triangles denote analysed positions)

24 HOURLY REAL TIME OBSERVED POSITIONS   
DATE/TIME OF FIRST SYMBOL 12Z 13 MAY 2004

## Impact of AIRS trial: +0.4/0.5 on NWP Index

## a) Global ATOVS

## b) Global & EARS

Extract all NESDIS  
MODIS winds valid from  
9z – 15z

## 1. Blacklisting

- All winds below 400 hPa over Greenland and Antarctica
- WV and CSWV below 600 hPa everywhere
- IR below 600 hPa over land and sea ice

## 2. Thinning

- one wind per 200 km x 200 km x 100 hPa box.

## 3. Background check

**Only use in update runs due to data timeliness issues**

22<sup>nd</sup> Jul – 19<sup>th</sup> Aug 2004

**NWP Index**

vs. OBS **+0.287**

vs. ANAL **+1.250**

# Summary of Satellite Data Usage (GLOBAL Model!)

	Last Conference	This Conference
ATOVS	<p><b>NOAA-15</b> AMSU (4-10,18,20)</p> <p><b>NOAA-16</b> HIRS (4-8,10-12,15), AMSU (4-8,10,18-20)</p> <p><b>NOAA-17</b> HIRS (4-8,10-12,15), AMSU (4-6, 8-10,18-20)</p>	<p><b>NOAA-15</b> AMSU (4-10,18,20)</p> <p><b>NOAA-16</b> AMSU (4-8,10, 18-20)</p> <p><b>EOS Aqua</b> AMSU-A (4-6,8-10)</p>
SSM/I	<b>F13</b> and <b>F15</b> windspeed	<b>F13</b> and <b>F15</b> windspeed
AIRS		<b>EOS Aqua</b> subset of 324 channels; clear sea only
MODIS		<b>EOS Aqua</b> and <b>EOS Terra</b>

# Timeliness of ATOVS Data

As with MODIS winds, we would expect increased benefit from assimilation of ATOVS observations if data were more timely

# Planned Improvements for the Coming Year

- Model Resolution Improvements by end of 2005
  - 40km horizontal resolution
  - 50 vertical levels
- 4D-Var background error covariance tuning
- Improved observation selection in 4D-Var
- Upgrade ATOVS processing to RTTOV8

- NOAA-18
  - Assimilation ASAP instead of Aqua/N16 once monitoring stable
  - Priority of N18 v N16
  
- SSMIS (See poster by Bell et al.)
  - Obs need correction and QC before 1D-Var
  - Trialling of QC'd radiances to begin this summer
  
- Alternative AIRS datasets
  - Warmest FOV

# Met Op Plans

- We intend to process ATOVS data separately as HIRS-1d
- Differences between IASI and current ATOVS/AIRS processing:
  - We will not store all the data and will subset obs/channels before 1D-Var.
  - Aim to store PCS and use reconstructed radiances ASAP.
  - Data stored will already be subject to gross QC and cloud tests.
- Future directions include:
  - Exploring options for less conservative use of IASI data, e.g.:
    - Using cloudy data
    - Assimilating as principal components.

- Major changes since last conference
  - 4D-Var Assimilation
  - Use of EOS Aqua data
  - Use of EARS data
  - RTTOV 7
- Coming changes
  - Higher resolution model
  - Use of NOAA-18, SSMIS
  - RTTOV 8
- Preparing for METOP
- Need Timely Data!

The background of the slide features a light blue color with several horizontal, wavy bands of a slightly darker shade of blue, creating a soft, water-like texture.

**Any Questions?**
